Description

ACPL-M21L (single channel SO-5 package), ACPL-021L (single channel SO-8 package), ACPL-024L (dual channel SO-8 package), ACPL-W21L (single channel stretched SO-6 package) and ACPL-K24L (dual channel stretched SO-8 package) are optically-coupled logic gates. The detector IC has CMOS output stage and optical receiver input stage with built-in Schmitt trigger to provide logic-compatible waveforms, eliminating the need for additional wave-shaping.

An internal shield on the ACPL-M21L/021L/024L/W21L/K24L guarantees common mode transient immunity of 25 kV/μs at a common mode voltage of 1000V. The ACPL-x2xL optocouplers' series operates from a 2.7 V to 5.5 V supply with guaranteed AC and DC performance from an extended temperature range of -40 °C to 105 °C. Glitches free output upon power-up and power-down of optocoupler.

Notes:

- t_{PHL} propagation delay is measured from the 50% (V_{in} or I_F) on the falling edge of the input pulse to the 50% V_{DD} of the falling edge of the V_O signal. t_{PLH} propagation delay is measured from the 50% (V_{in} or I_F) on the rising edge of the input pulse to the 50% level of the rising edge of the V_O signal
- PWD is defined as $|t_{PHL} - t_{PLH}|$
- t_{PSK} is equal to the magnitude of the worst case difference in t_{PHL} and/or t_{PLH} that will be seen between units at any given temperature within the recommended operating conditions.
- CM_H is the maximum tolerable rate of rise of the common mode voltage to assure that the output will remain in a high logic state.
- CM_L is the maximum tolerable rate of rise of the common mode voltage to assure that the output will remain in a low logic state.
- Use of a $0.1\ \mu\text{F}$ bypass capacitor connected between V_{DD} and ground is recommended.
