

The MB9A310A Series are a highly integrated 32-bit microcontroller that target for high-performance and cost-sensitive embedded control applications.

The MB9A310A Series are based on the ARM Cortex-M3 Processor and on-chip Flash memory and SRAM, and peripheral functions, including Motor Control Timers, ADCs and Communication Interfaces (USB, UART, CSIO, I²C, LIN).

The products which are described in this datasheet are placed into TYPE1 product categories in "FM3 Family Peripheral Manual".

Features

32-bit ARM[®] Cortex[®]-M3 Core

- Processor version: r2p1
- Up to 40MHz Frequency Operation
- Integrated Nested Vectored Interrupt Controller (NVIC): 1 NMI (non-maskable interrupt) and 48 peripheral interrupts and 16 priority levels
- 24-bit System timer (Sys Tick): System timer for OS task management

On-chip Memories

[Flash memory]

- Up to 512 Kbyte
- Read cycle: 0 wait-cycle
- Security function for code protection

[SRAM]

This Series contain a total of up to 32Kbyte on-chip SRAM. On-chip SRAM is composed of two independent SRAM (SRAM0,SRAM1). SRAM0 is connected to I-code bus and D-code bus of Cortex-M3 core. SRAM1 is connected to System bus.

- SRAM0: Up to 16 Kbytes
- SRAM1: Up to 16 Kbytes

USB Interface

USB interface is composed of Function and Host. PLL for USB is built-in, USB clock can be generated by multiplication of Main clock.

[USB function]

- USB2.0 Full-Speed supported
- Max 6 EndPoint supported
 - EndPoint 0 is control transfer
 - EndPoint 1,2 can be selected Bulk-transfer, Interrupt-transfer or Isochronous-transfer
 - EndPoint 3,4 and 5 can be selected Bulk-transfer, Interrupt-transfer
 - EndPoint1-5 is comprised Double Buffer
 - Endpoint 0, 2 to 5: 64bytes
 - Endpoint 1: 256bytes

[USB host]

- USB2.0 Full/Low speed supported
- Bulk-transfer, interrupt-transfer and Isochronous-transfer support
- USB Device connected/dis-connected automatically detect
- IN/OUT token handshake packet automatically
- Max 256-byte packet-length supported
- Wake-up function supported

Multi-function Serial Interface (Max eight channels)

- 4 channels with 16steps × 9bit FIFO (ch.4-ch.7), 4 channels without FIFO (ch.0-ch.3)
- Operation mode is selectable from the followings for each channel.
 - UART
 - CSIO
 - LIN
 - I²C

[UART]

- Full duplex double buffer
- Selection with or without parity supported
- Built-in dedicated baud rate generator
- External clock available as a serial clock
- Hardware Flow control : Automatically control the transmission by CTS/RTS (only ch.4)*
- Various error detection functions available (parity errors, framing errors, and overrun errors)
*: MB9AF311LA, F312LA and F314LA do not support Hardware Flow control

[CSIO]

- Full-duplex double buffer
- Built-in dedicated baud rate generator
- Overrun error detection function available

[LIN]

- LIN protocol Rev.2.1 supported
- Full-duplex double buffer
- Master/Slave mode supported
- LIN break field generation (can be changed 13-16bit length)
- LIN break delimiter generation (can be changed 1-4bit length)
- Various error detection functions available (parity errors, framing errors, and overrun errors)

[I²C]

Standard-mode (Max 100kbps) / Fast-mode (Max 400kbps) supported

External Bus Interface*

- Supports SRAM, NOR Flash device
- Up to 8 chip selects
- 8/16-bit Data width
- Up to 25-bit Address bit
- Maximum area size : Up to 256 Mbytes
- Supports Address/Data multiplex
- Supports external RDY function
*: MB9AF311LA, F312LA and F314LA do not support External Bus Interface

DMA Controller (8channels)

The DMA Controller has an independent bus from the CPU, so CPU and DMA Controller can process simultaneously.

- 8 independently configured and operated channels
- Transfer can be started by software or request from the built-in peripherals
- Transfer address area: 32bit (4Gbytes)
- Transfer mode: Block transfer/Burst transfer/Demand transfer
- Transfer data type: byte/half-word/word
- Transfer block count: 1 to 16
- Number of transfers: 1 to 65536

A/D Converter (Max 16channels)

[12-bit A/D Converter]

- Successive Approximation type
- Built-in 3units*
- Conversion time: 1.0μs@5V
- Priority conversion available (priority at 2levels)
- Scanning conversion mode
- Built-in FIFO for conversion data storage (for SCAN conversion: 16steps, for Priority conversion: 4 steps)
*: MB9AF311LA, F312LA, F314LA built-in 2units

Base Timer (Max 8channels)

Operation mode is selectable from the followings for each channel.

- 16-bit PWM timer
- 16-bit PPG timer
- 16/32-bit reload timer
- 16/32-bit PWC timer

Multi-function Timer (Max 2units)

The Multi-function timer is composed of the following blocks.

- 16-bit free-run timer × 3ch/unit
- Input capture × 4ch/unit
- Output compare × 6ch/unit
- A/D activation compare × 3ch/unit
- Waveform generator × 3ch/unit
- 16-bit PPG timer × 3ch/unit

The following function can be used to achieve the motor control.

- PWM signal output function
- DC chopper waveform output function
- Dead time function
- Input capture function
- A/D converter activate function
- DTIF (Motor emergency stop) interrupt function

Quadrature Position/Revolution Counter (QPRC) (Max 2units)

The Quadrature Position/Revolution Counter (QPRC) is used to measure the position of the position encoder. Moreover, it is possible to use up/down counter.

- The detection edge of the three external event input pins AIN, BIN and ZIN is configurable.
- 16-bit position counter
- 16-bit revolution counter
- Two 16-bit compare registers

Dual Timer (32/16bit Down Counter)

The Dual Timer consists of two programmable 32/16-bit down counters. Operation mode is selectable from the followings for each timer channel.

- Free-running
- Periodic (=Reload)
- One-shot

Watch Counter

The Watch counter is used for wake up from Low-Power Consumption mode.

Interval timer: up to 64s (Max) @ Sub Clock: 32.768kHz

Watch dog Timer (2channels)

A watchdog timer can generate interrupts or a reset when a time-out value is reached.

This series consists of two different watchdogs, a "Hardware" watchdog and a, "Software" watchdog.

The "Hardware" watchdog timer is clocked by the built-in low speed CR oscillator. Therefore, the "Hardware" watchdog is active in any low-power consumption modes except STOP mode.

External Interrupt Controller Unit

- Up to 16 external interrupt input pins.
- Include one non-maskable interrupt (NMI) input pin.

General-Purpose I/O Port

This series can use its pins as general-purpose I/O ports when they are not used for external bus or peripherals. Moreover, the port relocate function is built in. It can set which I/O port the peripheral function can be allocated to.

- Capable of pull-up control per pin
- Capable of reading pin level directly
- Built-in the port relocate function
- Up to 83 fast General Purpose I/O Ports @ 100pin Package
- Some ports are 5V tolerant I/O (MB9AF315MA/NA, MB9AF316MA/NA only)
Please see "Pin Description" to confirm the corresponding pins.

CRC (Cyclic Redundancy Check) Accelerator

The CRC accelerator calculates the CRC which has a heavy software processing load, and achieves a reduction of the integrity check processing load for reception data and storage. CCITT CRC16 and IEEE-802.3 CRC32 are supported.

- CCITT CRC16 Generator Polynomial: 0x1021
- IEEE-802.3 CRC32 Generator Polynomial: 0x04C11DB7

Clock and Reset

[Clocks]

Selectable from five clock sources (2 external oscillators, 2 built-in CR oscillators, and Main PLL).

- Main Clock : 4MHz to 48MHz
- Sub Clock : 32.768kHz
- Built-in high-speed CR Clock : 4MHz
- Built-in low-speed CR Clock : 100kHz
- Main PLL Clock

[Resets]

- Reset requests from INITX pins
- Power-on reset
- Software reset
- Watchdog timers reset
- Low-voltage detector reset
- Clock supervisor reset

Clock Super Visor (CSV)

Clocks generated by built-in CR oscillators are used to supervise abnormality of the external clocks.

- External clock failure (clock stop) is detected, reset is asserted.
- External frequency anomaly is detected, interrupt or reset is asserted.

Low-Voltage Detector (LVD)

This Series include 2-stage monitoring of voltage on the VCC. When the voltage falls below the voltage that has been set, Low-Voltage Detector generates an interrupt or reset.

- LVD1: error reporting via interrupt
- LVD2: auto-reset operation

Low-Power Consumption Mode

Three Low-Power Consumption modes supported.

- SLEEP
- TIMER
- STOP

Debug

- Serial Wire JTAG Debug Port (SWJ-DP)
- Embedded Trace Macrocells (ETM).*
*: MB9AF311LA/MA, F312LA/MA, F314LA/MA, F315MA and F316MA support only SWJ-DP.

Power Supply

- Two Power Supplies
- VCC = 2.7V to 5.5V: Correspond to the wide range voltage.
- USBVCC = 3.0V to 3.6V: for USB I/O power supply, when USB is used.
= 2.7V to 5.5V: when GPIO is used.

List of pin functions

The number after the underscore ("_") in pin names such as XXX_1 and XXX_2 indicates the relocated port number. For these pins, there are multiple pins that provide the same function for the same channel. Use the extended port function register (EPFR) to select the pin.

6. Handling Precautions

Any semiconductor devices have inherently a certain rate of failure. The possibility of failure is greatly affected by the conditions in which they are used (circuit conditions, environmental conditions, etc.). This page describes precautions that must be observed to minimize the chance of failure and to obtain higher reliability from your Cypress semiconductor devices.

6.1 Precautions for Product Design

This section describes precautions when designing electronic equipment using semiconductor devices.

Absolute Maximum Ratings

Semiconductor devices can be permanently damaged by application of stress (voltage, current, temperature, etc.) in excess of certain established limits, called absolute maximum ratings. Do not exceed these ratings.

Recommended Operating Conditions

Recommended operating conditions are normal operating ranges for the semiconductor device. All the device's electrical characteristics are warranted when operated within these ranges.

Always use semiconductor devices within the recommended operating conditions. Operation outside these ranges may adversely affect reliability and could result in device failure.

No warranty is made with respect to uses, operating conditions, or combinations not represented on the data sheet. Users considering application outside the listed conditions are advised to contact their sales representative beforehand.

Processing and Protection of Pins

These precautions must be followed when handling the pins which connect semiconductor devices to power supply and input/output functions.

1. Preventing Over-Voltage and Over-Current Conditions

Exposure to voltage or current levels in excess of maximum ratings at any pin is likely to cause deterioration within the device, and in extreme cases leads to permanent damage of the device. Try to prevent such overvoltage or over-current conditions at the design stage.

2. Protection of Output Pins

Shorting of output pins to supply pins or other output pins, or connection to large capacitance can cause large current flows. Such conditions if present for extended periods of time can damage the device. Therefore, avoid this type of connection.

3. Handling of Unused Input Pins

Unconnected input pins with very high impedance levels can adversely affect stability of operation. Such pins should be connected through an appropriate resistance to a power supply pin or ground pin.

Latch-up

Semiconductor devices are constructed by the formation of P-type and N-type areas on a substrate. When subjected to abnormally high voltages, internal parasitic PNP junctions (called thyristor structures) may be formed, causing large current levels in excess of several hundred mA to flow continuously at the power supply pin. This condition is called latch-up.

CAUTION: The occurrence of latch-up not only causes loss of reliability in the semiconductor device, but can cause injury or damage from high heat, smoke or flame. To prevent this from happening, do the following:

1. Be sure that voltages applied to pins do not exceed the absolute maximum ratings. This should include attention to abnormal noise, surge levels, etc.
2. Be sure that abnormal current flows do not occur during the power-on sequence.

Observance of Safety Regulations and Standards

Most countries in the world have established standards and regulations regarding safety, protection from electromagnetic interference, etc. Customers are requested to observe applicable regulations and standards in the design of products.

Fail-Safe Design

Any semiconductor devices have inherently a certain rate of failure. You must protect against injury, damage or loss from such failures by incorporating safety design measures into your facility and equipment such as redundancy, fire protection, and prevention of over-current levels and other abnormal operating conditions.

Precautions Related to Usage of Devices

Cypress semiconductor devices are intended for use in standard applications (computers, office automation and other office equipment, industrial, communications, and measurement equipment, personal or household devices, etc.).

CAUTION: Customers considering the use of our products in special applications where failure or abnormal operation may directly affect human lives or cause physical injury or property damage, or where extremely high levels of reliability are demanded (such as aerospace systems, atomic energy controls, sea floor repeaters, vehicle operating controls, medical devices for life support, etc.) are requested to consult with sales representatives before such use. The company will not be responsible for damages arising from such use without prior approval.

6.2 Precautions for Package Mounting

Package mounting may be either lead insertion type or surface mount type. In either case, for heat resistance during soldering, you should only mount under Cypress recommended conditions. For detailed information about mount conditions, contact your sales representative.

Lead Insertion Type

Mounting of lead insertion type packages onto printed circuit boards may be done by two methods: direct soldering on the board, or mounting by using a socket.

Direct mounting onto boards normally involves processes for inserting leads into through-holes on the board and using the flow soldering (wave soldering) method of applying liquid solder. In this case, the soldering process usually causes leads to be subjected to thermal stress in excess of the absolute ratings for storage temperature. Mounting processes should conform to Cypress recommended mounting conditions.

If socket mounting is used, differences in surface treatment of the socket contacts and IC lead surfaces can lead to contact deterioration after long periods. For this reason it is recommended that the surface treatment of socket contacts and IC leads be verified before mounting.

Surface Mount Type

Surface mount packaging has longer and thinner leads than lead-insertion packaging, and therefore leads are more easily deformed or bent. The use of packages with higher pin counts and narrower pin pitch results in increased susceptibility to open connections caused by deformed pins, or shorting due to solder bridges.

You must use appropriate mounting techniques. Cypress recommends the solder reflow method, and has established a ranking of mounting conditions for each product. Users are advised to mount packages in accordance with Cypress ranking of recommended conditions.

Lead-Free Packaging

CAUTION: When ball grid array (BGA) packages with Sn-Ag-Cu balls are mounted using Sn-Pb eutectic soldering, junction strength may be reduced under some conditions of use.

Storage of Semiconductor Devices

Because plastic chip packages are formed from plastic resins, exposure to natural environmental conditions will cause absorption of moisture. During mounting, the application of heat to a package that has absorbed moisture can cause surfaces to peel, reducing moisture resistance and causing packages to crack. To prevent, do the following:

1. Avoid exposure to rapid temperature changes, which cause moisture to condense inside the product. Store products in locations where temperature changes are slight.
2. Use dry boxes for product storage. Products should be stored below 70% relative humidity, and at temperatures between 5°C and 30°C.
When you open Dry Package that recommends humidity 40% to 70% relative humidity.
3. When necessary, Cypress packages semiconductor devices in highly moisture-resistant aluminum laminate bags, with a silica gel desiccant. Devices should be sealed in their aluminum laminate bags for storage.
4. Avoid storing packages where they are exposed to corrosive gases or high levels of dust.

Baking

Packages that have absorbed moisture may be de-moisturized by baking (heat drying). Follow the Cypress recommended conditions for baking.

Condition: 125°C/24 h

Static Electricity

Because semiconductor devices are particularly susceptible to damage by static electricity, you must take the following precautions:

1. Maintain relative humidity in the working environment between 40% and 70%. Use of an apparatus for ion generation may be needed to remove electricity.
2. Electrically ground all conveyors, solder vessels, soldering irons and peripheral equipment.
3. Eliminate static body electricity by the use of rings or bracelets connected to ground through high resistance (on the level of 1 MΩ).
Wearing of conductive clothing and shoes, use of conductive floor mats and other measures to minimize shock loads is recommended.
4. Ground all fixtures and instruments, or protect with anti-static measures.
5. Avoid the use of styrofoam or other highly static-prone materials for storage of completed board assemblies.

6.3 Precautions for Use Environment

Reliability of semiconductor devices depends on ambient temperature and other conditions as described above.

For reliable performance, do the following:

1. Humidity
Prolonged use in high humidity can lead to leakage in devices as well as printed circuit boards. If high humidity levels are anticipated, consider anti-humidity processing.
2. Discharge of Static Electricity
When high-voltage charges exist close to semiconductor devices, discharges can cause abnormal operation. In such cases, use anti-static measures or processing to prevent discharges.
3. Corrosive Gases, Dust, or Oil
Exposure to corrosive gases or contact with dust or oil may lead to chemical reactions that will adversely affect the device. If you use devices in such conditions, consider ways to prevent such exposure or to protect the devices.
4. Radiation, Including Cosmic Radiation
Most devices are not designed for environments involving exposure to radiation or cosmic radiation. Users should provide shielding as appropriate.
5. Smoke, Flame
CAUTION: Plastic molded devices are flammable, and therefore should not be used near combustible substances. If devices begin to smoke or burn, there is danger of the release of toxic gases.

Customers considering the use of Cypress products in other special environmental conditions should consult with sales representatives.

7. Handling Devices

Power supply pins

In products with multiple VCC and VSS pins, respective pins at the same potential are interconnected within the device in order to prevent malfunctions such as latch-up. However, all of these pins should be connected externally to the power supply or ground lines in order to reduce electromagnetic emission levels, to prevent abnormal operation of strobe signals caused by the rise in the ground level, and to conform to the total output current rating.

Moreover, connect the current supply source with each Power supply pin and GND pin of this device at low impedance. It is also advisable that a ceramic capacitor of approximately 0.1 μF be connected as a bypass capacitor between each Power supply pin and GND pin, between AVCC pin and AVSS pin near this device.

Stabilizing power supply voltage

A malfunction may occur when the power supply voltage fluctuates rapidly even though the fluctuation is within the recommended operating conditions of the VCC power supply voltage. As a rule, with voltage stabilization, suppress the voltage fluctuation so that the fluctuation in VCC ripple (peak-to-peak value) at the commercial frequency (50 Hz/60 Hz) does not exceed 10% of the VCC value in the recommended operating conditions, and the transient fluctuation rate does not exceed 0.1 V/ μs when there is a momentary fluctuation on switching the power supply.

Crystal oscillator circuit

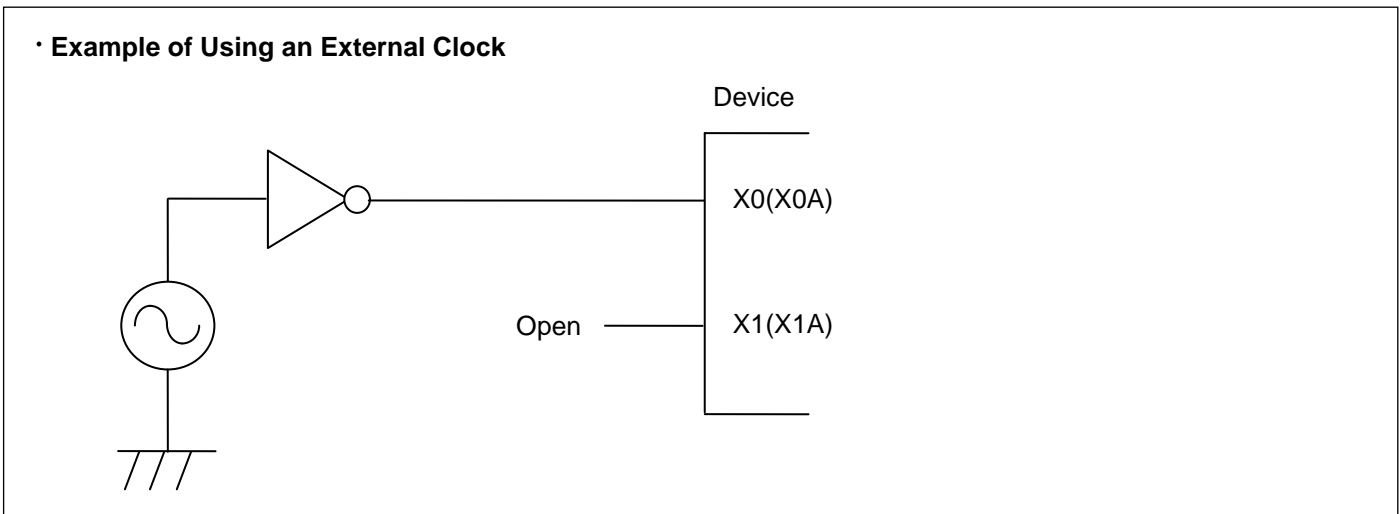

Noise near the X0/X1 and X0A/X1A pins may cause the device to malfunction. Design the printed circuit board so that X0/X1, X0A/X1A pins, the crystal oscillator, and the bypass capacitor to ground are located as close to the device as possible.

It is strongly recommended that the PC board artwork be designed such that the X0/X1 and X0A/X1A pins are surrounded by ground plane as this is expected to produce stable operation.

Evaluate oscillation of your using crystal oscillator by your mount board.

Using an external clock

When using an external clock, the clock signal should be driven to the X0,X0A pin only and the X1,X1A pin should be kept open.

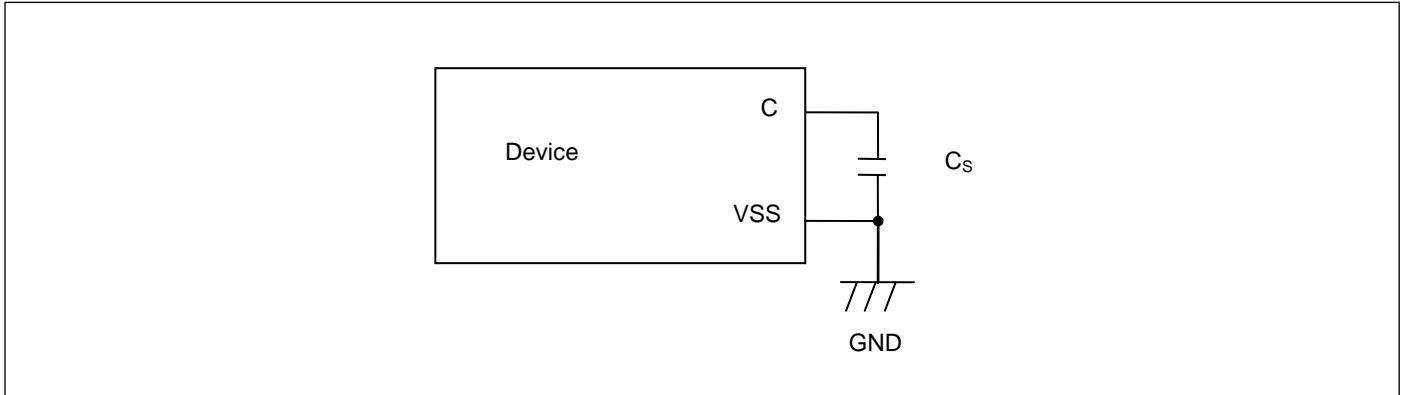

Handling when using Multi-function serial pin as I²C pin

If it is using the multi function serial pin as I²C pins, P-ch transistor of digital output is always disabled. However, I²C pins need to keep the electrical characteristic like other pins and not to connect to the external I²C bus system with power OFF.

C Pin

This series contains the regulator. Be sure to connect a smoothing capacitor (C_s) for the regulator between the C pin and the GND pin. Please use a ceramic capacitor or a capacitor of equivalent frequency characteristics as a smoothing capacitor. However, some laminated ceramic capacitors have the characteristics of capacitance variation due to thermal fluctuation (F characteristics and Y5V characteristics). Please select the capacitor that meets the specifications in the operating conditions to use by evaluating the temperature characteristics of a capacitor. A smoothing capacitor of about $4.7\mu\text{F}$ would be recommended for this series.

Mode pins (MD0)

Connect the MD pin (MD0) directly to VCC or VSS pins. Design the printed circuit board such that the pull-up/down resistor stays low, as well as the distance between the mode pins and VCC pins or VSS pins is as short as possible and the connection impedance is low, when the pins are pulled-up/down such as for switching the pin level and rewriting the Flash memory data. It is because of preventing the device erroneously switching to test mode due to noise.

Notes on power-on

Turn power on/off in the following order or at the same time.
If not using the A/D converter, connect $\text{AVCC} = \text{VCC}$ and $\text{AVSS} = \text{VSS}$.

Turning on: $\text{VCC} \rightarrow \text{USBVCC}$
 $\text{VCC} \rightarrow \text{AVCC} \rightarrow \text{AVRH}$

Turning off: $\text{USBVCC} \rightarrow \text{VCC}$
 $\text{AVRH} \rightarrow \text{AVCC} \rightarrow \text{VCC}$

Serial Communication

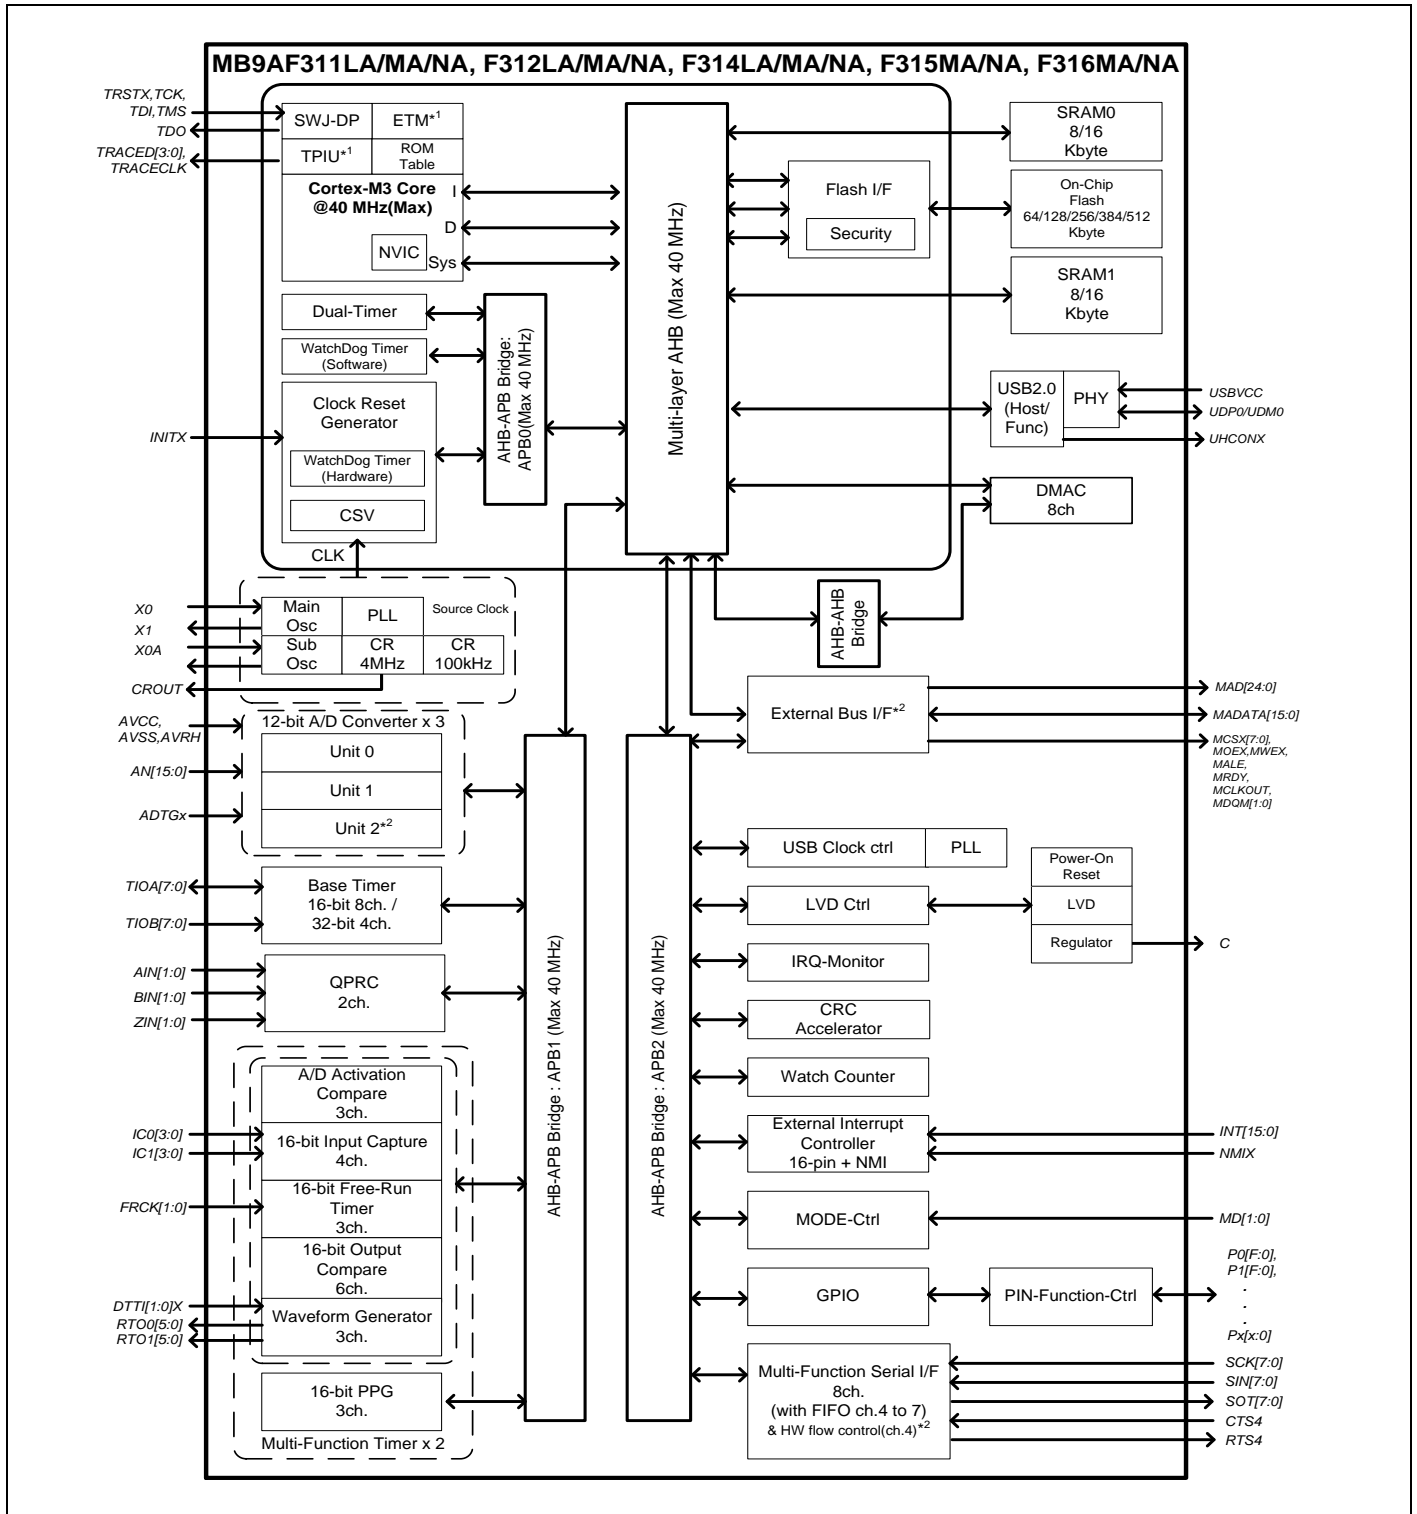

There is a possibility to receive wrong data due to the noise or other causes on the serial communication. Therefore, design a printed circuit board so as to avoid noise. Consider the case of receiving wrong data due to noise, perform error detection such as by applying a checksum of data at the end. If an error is detected, retransmit the data.

Differences in features among the products with different memory sizes and between Flash products and MASK products

The electric characteristics including power consumption, ESD, latch-up, noise characteristics, and oscillation characteristics among the products with different memory sizes and between Flash products and MASK products are different because chip layout and memory structures are different.

If you are switching to use a different product of the same series, please make sure to evaluate the electric characteristics.

11. Pin Status in Each CPU State

The terms used for pin status have the following meanings.

■ INITX=0

This is the period when the INITX pin is the "L" level.

■ INITX=1

This is the period when the INITX pin is the "H" level.

■ SPL=0

This is the status that the standby pin level setting bit (SPL) in the standby mode control register (STB_CTL) is set to "0".

■ SPL=1

This is the status that the standby pin level setting bit (SPL) in the standby mode control register (STB_CTL) is set to "1".

■ Input enabled

Indicates that the input function can be used.

■ Internal input fixed at "0"

This is the status that the input function cannot be used. Internal input is fixed at "L".

■ Hi-Z

Indicates that the pin drive transistor is disabled and the pin is put in the Hi-Z state.

■ Setting disabled

Indicates that the setting is disabled.

■ Maintain previous state

Maintains the state that was immediately prior to entering the current mode.

If a built-in peripheral function is operating, the output follows the peripheral function.
If the pin is being used as a port, that output is maintained.

■ Analog input is enabled

Indicates that the analog input is enabled.

■ Trace output

Indicates that the trace function can be used.

*3: USBV_{CC} must not drop below V_{SS} - 0.5V.

*4: Be careful not to exceed V_{CC} + 0.5 V, for example, when the power is turned on.

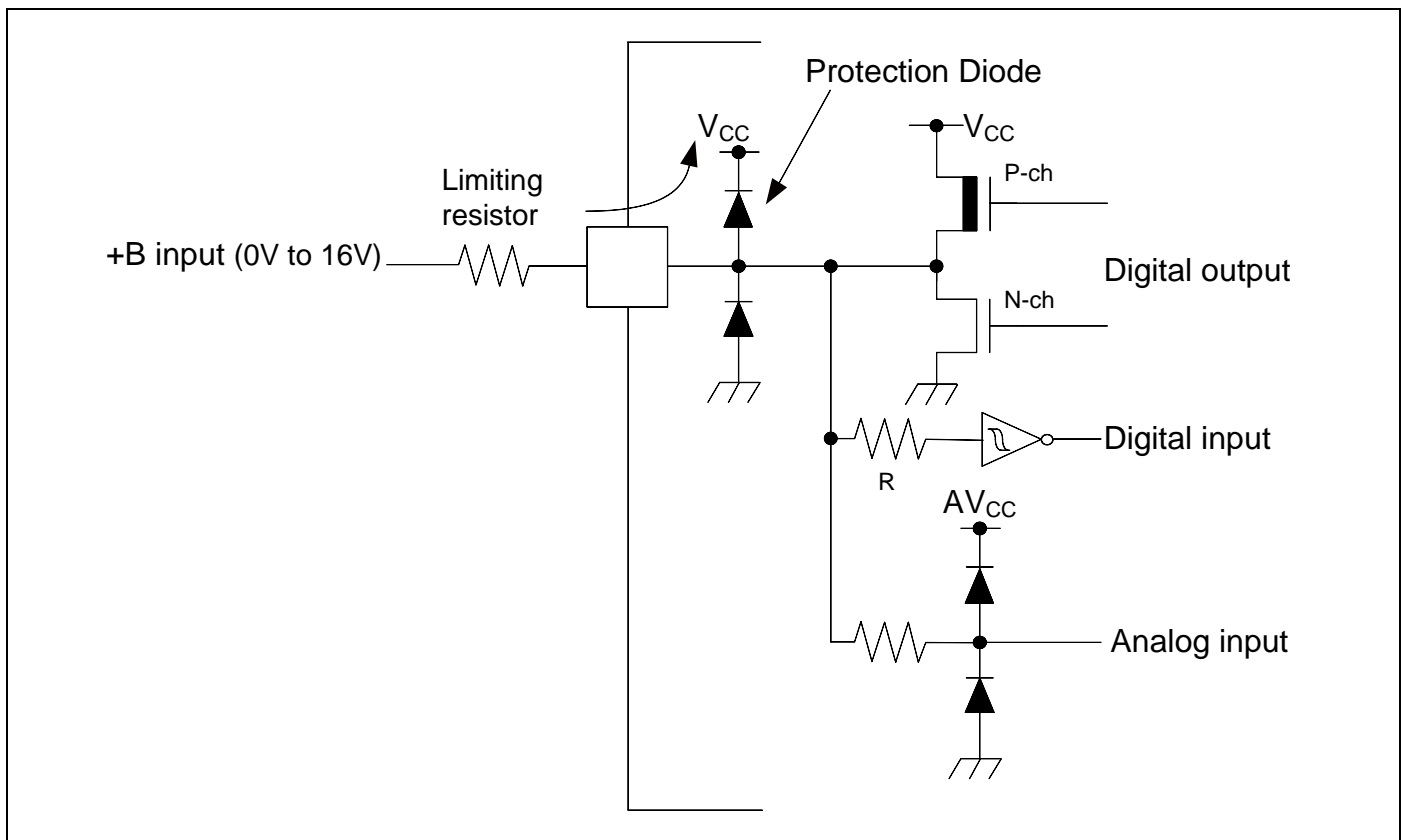

*5: The maximum output current is defined as the value of the peak current flowing through any one of the corresponding pins.

*6: The average output current is defined as the average current value flowing through any one of the corresponding pins for a 100 ms period.

*7: The total average output current is defined as the average current value flowing through all of corresponding pins for a 100 ms.

*8:

- See “4. List of Pin Functions” and “5. I/O Circuit Type” about +B input available pin.
- Use within recommended operating conditions.
- Use at DC voltage (current) the +B input.
- The +B signal should always be applied a limiting resistance placed between the +B signal and the device.
- The value of the limiting resistance should be set so that when the +B signal is applied the input current to the device pin does not exceed rated values, either instantaneously or for prolonged periods.
- Note that when the device drive current is low, such as in the low-power consumption modes, the +B input potential may pass through the protective diode and increase the potential at the VCC and AVCC pin, and this may affect other devices.
- Note that if a +B signal is input when the device power supply is off (not fixed at 0V), the power supply is provided from the pins, so that incomplete operation may result.
- The following is a recommended circuit example (I/O equivalent circuit).

WARNING:

Semiconductor devices can be permanently damaged by application of stress (voltage, current, temperature, etc.) in excess of absolute maximum ratings. Do not exceed these ratings.

*2: When P81/UDP0 and P80/UDM0 pin are used as GPIO (P81, P80).

*3: See "C Pin" in "7. Handling Devices" for the connection of the smoothing capacitor.

*4: In between less than the minimum power supply voltage and low voltage reset/interrupt detection voltage or more, instruction execution and low voltage detection function by built-in High-speed CR (including Main PLL is used) or built-in Low-speed CR is possible to operate only.

WARNING:

The recommended operating conditions are required in order to ensure the normal operation of the semiconductor device. All of the device's electrical characteristics are warranted when the device is operated within these ranges.

Always use semiconductor devices within their recommended operating condition ranges. Operation outside these ranges may adversely affect reliability and could result in device failure. No warranty is made with respect to uses, operating conditions, or combinations not represented on the data sheet. Users considering application outside the listed conditions are advised to contact their representatives beforehand.

*1; R and C represent the pull-up resistance and load capacitance of the SCL and SDA lines, respectively.

V_p indicates the power supply voltage of the pull-up resistance and I_{OL} indicates V_{OL} guaranteed current.

*2: The maximum t_{HDDAT} must satisfy that it doesn't extend at least "L" period (t_{LOW}) of device's SCL signal.

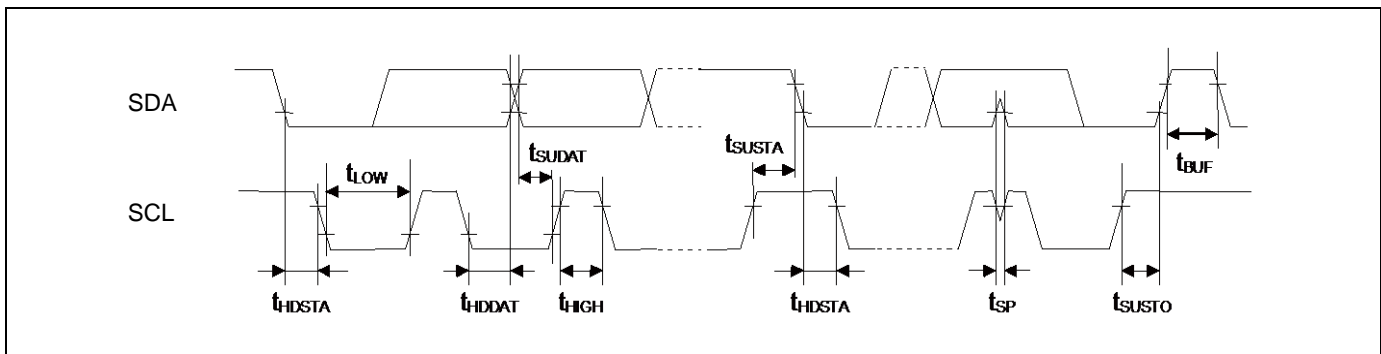

*3: Fast-mode I²C bus device can be used on Standard-mode I²C bus system as long as the device satisfies the requirement of "t_{SUDAT} ≥ 250 ns".

*4: t_{CYCP} is the APB bus clock cycle time.

About the APB bus number that I2C is connected to, see "8. Block Diagram" in this datasheet.

To use Standard-mode, set the APB bus clock at 2 MHz or more.

To use Fast-mode, set the APB bus clock at 8 MHz or more.

*1: The conversion time is the value of sampling time (T_s) + compare time (T_c).

The condition of the minimum conversion time is the following.

AV_{CC} ≥ 4.5V, HCLK=40MHz sampling time: 300ns, compare time: 700ns

AV_{CC} < 4.5V, HCLK=40MHz sampling time: 500ns, compare time: 700ns

Ensure that it satisfies the value of the sampling time (T_s) and compare clock cycle (T_{ck}).

For setting of the sampling time and compare clock cycle, see "Chapter 1-1: A/D Converter" in "FM3 Family Peripheral Manual Analog Macro Part".

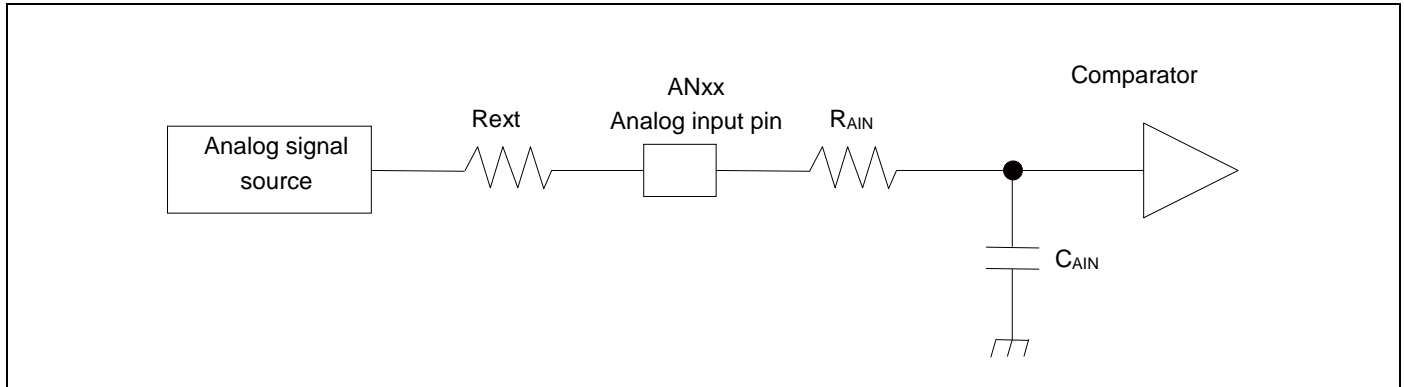

The A/D Converter register is set at APB bus clock timing. The sampling clock and compare clock are set at Base clock (HCLK).

About the APB bus number which the A/D Converter is connected to, see "8. Block Diagram" in this datasheet.

*2: A necessary sampling time changes by external impedance.

Ensure that it set the sampling time to satisfy (Equation 1)

*3: The compare time (T_c) is the value of (Equation 2)

(Equation 1) $T_s \geq (R_{AIN} + R_{ext}) \times C_{AIN} \times 9$

T_s : Sampling time

R_{AIN} : input resistor of A/D = 2k Ω $4.5 \leq AV_{CC} \leq 5.5$

input resistor of A/D = 3.8k Ω $2.7 \leq AV_{CC} < 4.5$

C_{AIN} : input capacity of A/D = 12.9pF $2.7 \leq AV_{CC} \leq 5.5$

R_{ext} : Output impedance of external circuit

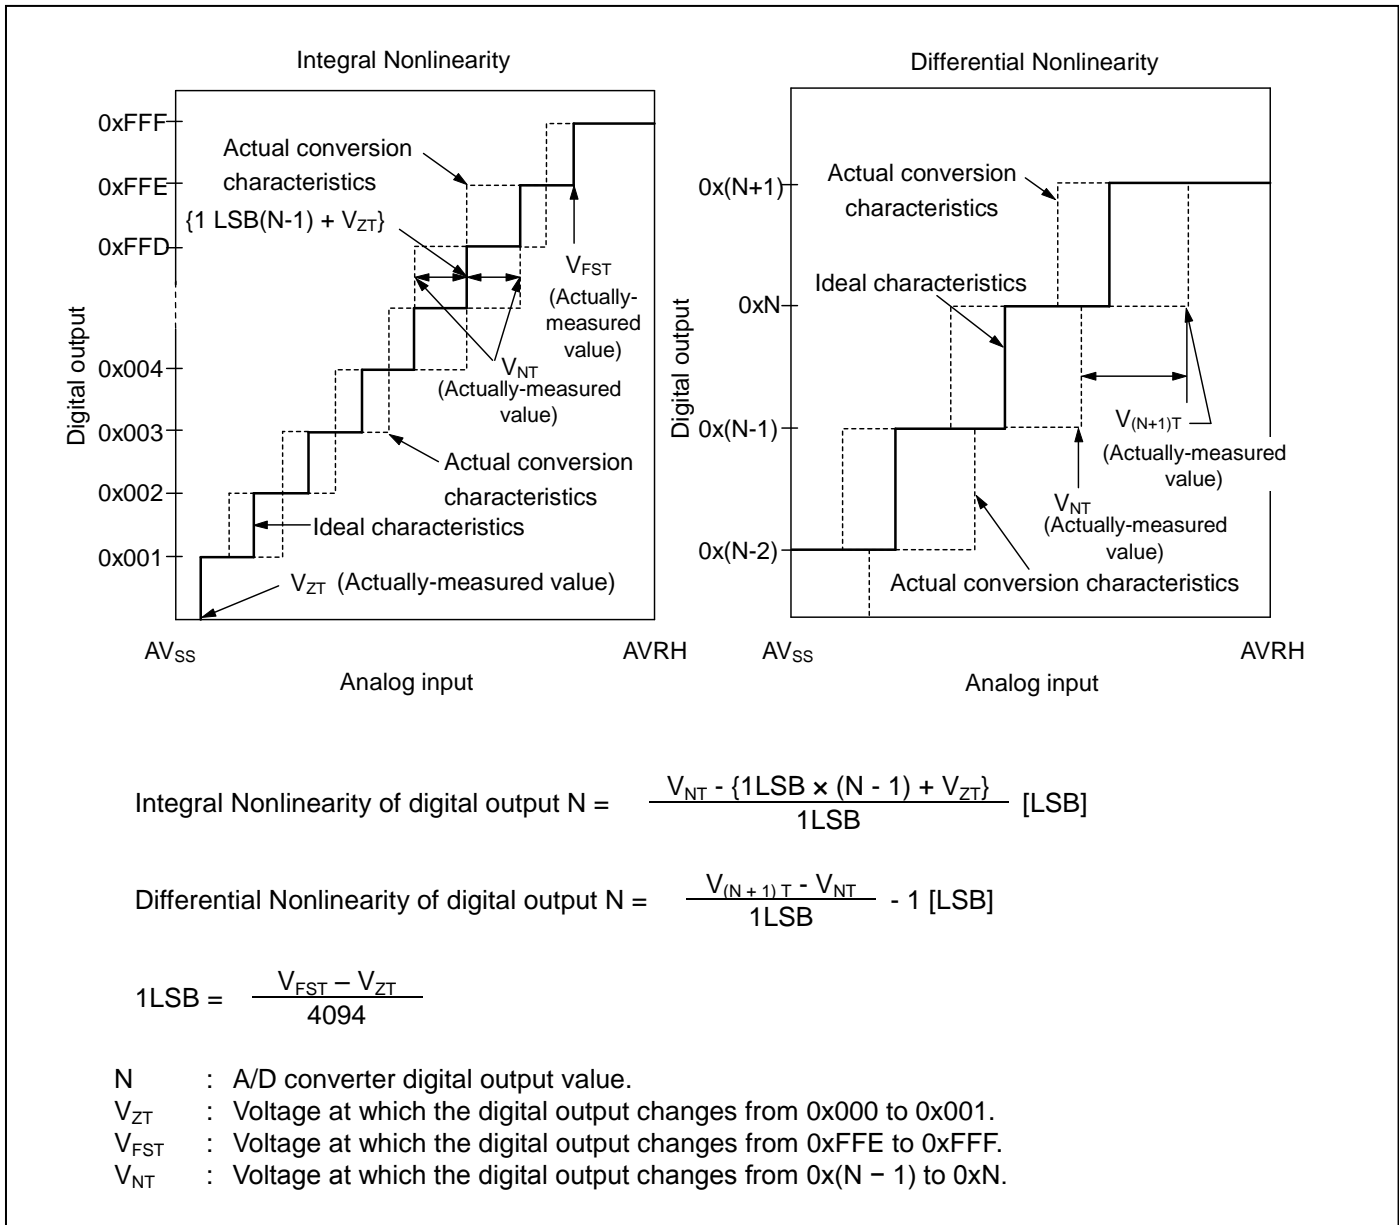

(Equation 2) $T_c = T_{cck} \times 14$

T_c : Compare time

T_{cck} : Compare clock cycle

Definition of 12-bit A/D Converter Terms

- Resolution : Analog variation that is recognized by an A/D converter.
- Integral Nonlinearity : Deviation of the line between the zero-transition point (0b000000000000↔0b000000000001) and the full-scale transition point (0b111111111110↔0b111111111111) from the actual conversion characteristics.
- Differential Nonlinearity : Deviation from the ideal value of the input voltage that is required to change the output code by 1 LSB.

12.6 USB characteristics

(V_{CC} = 2.7V to 5.5V, USBV_{CC} = 3.0V to 3.6V, V_{SS} = 0V, T_a = - 40°C to + 105°C)

Parameter	Symbol	Pin name	Conditions	Value		Unit	Remarks

	Different common mode range	V _{CM}		0.8	2.5	V	*2	
Output characteristics	Output High level voltage	V _{OH}	UDP0, UDM0	External pull-down resistance = 15kΩ	2.8	3.6	V	*3
	Output Low level voltage	V _{OL}		External pull-up resistance = 1.5kΩ	0.0	0.3	V	*3
	Crossover voltage	V _{CRS}		-	1.3	2.0	V	*4
	Rising time	t _{FR}		Full Speed	4	20	ns	*5
	Falling time	t _{FF}		Full Speed	4	20	ns	*5
	Rise/fall time matching	t _{FRFM}		Full Speed	90	111.11	%	*5
	Output impedance	Z _{DRV}		Full Speed	28	44	Ω	*6
	Rising time	t _{LR}		Low Speed	75	300	ns	*7
	Falling time	t _{LF}		Low Speed	75	300	ns	*7
	Rise/fall time matching	t _{LRFM}		Low Speed	80	125	%	*7

*1: The switching threshold voltage of Single-End-Receiver of USB I/O buffer is set as within V_{IL} (Max) = 0.8V, V_{IH} (Min) = 2.0 V (TTL input standard). There are some hystereses to lower noise sensitivity.

*2: Use differential-Receiver to receive USB differential data signal. Differential-Receiver has 200 mV of differential input sensitivity when the differential data input is within 0.8 V to 2.5 V to the local ground reference level. Above voltage range is the common mode input voltage range.

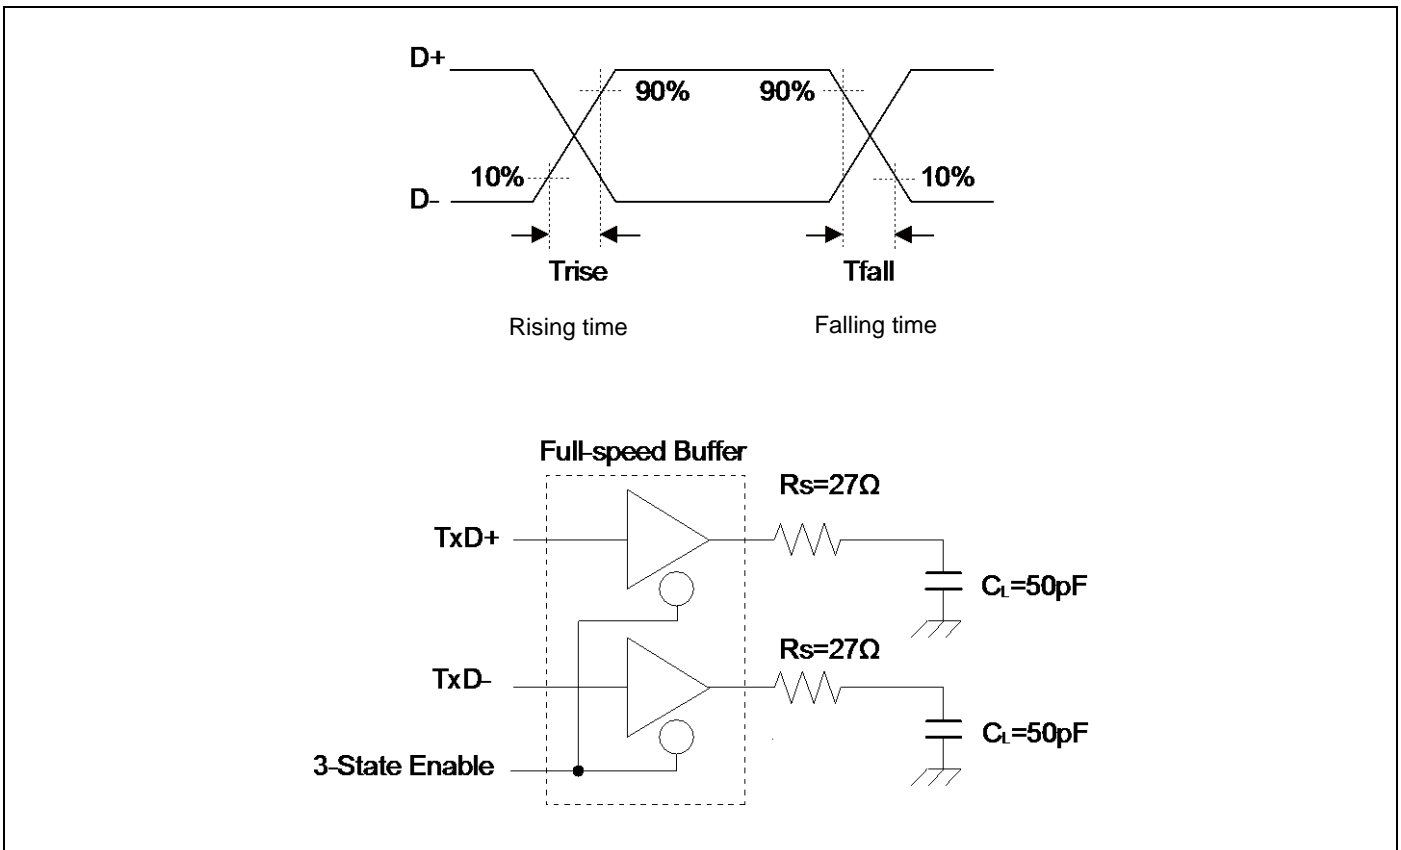

*3: The output drive capability of the driver is below 0.3 V at Low-State (V_{OL}) (to 3.6 V and 1.5 k Ω load), and 2.8 V or above (to the ground and 1.5 k Ω load) at High-State (V_{OH}).

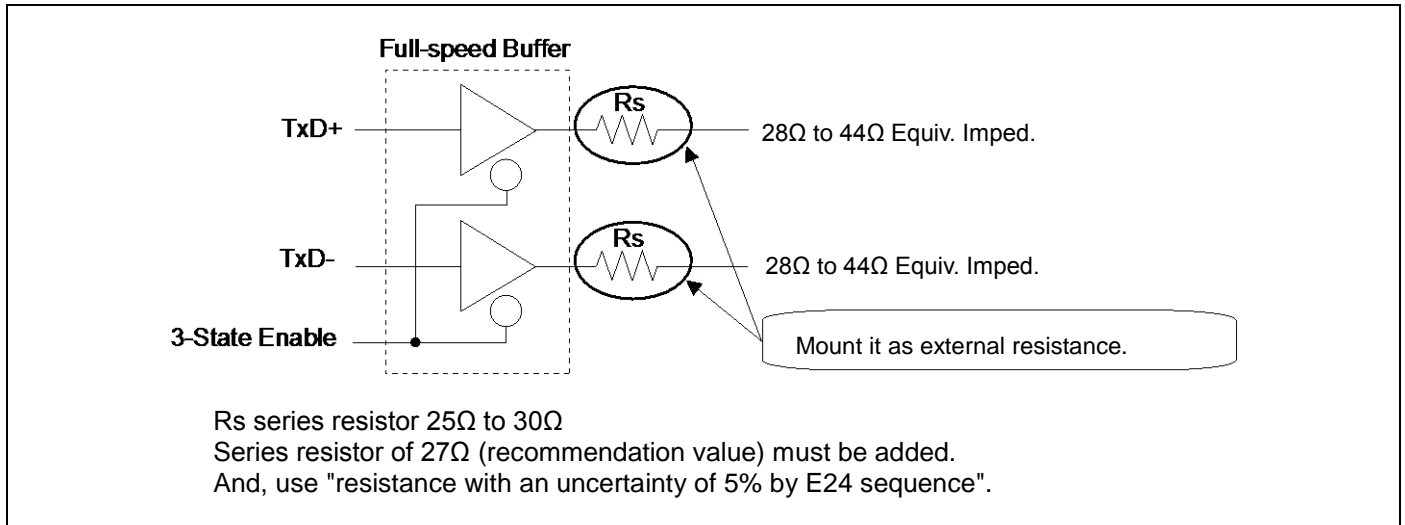

*4: The cross voltage of the external differential output signal (D + /D -) of USB I/O buffer is within 1.3 V to 2.0 V.

*5: They indicate rising time (T_{rise}) and falling time (T_{fall}) of the full-speed differential data signal. They are defined by the time between 10% and 90% of the output signal voltage. For full-speed buffer, T_r/T_f ratio is regulated as within $\pm 10\%$ to minimize RFI emission.

*6: USB Full-speed connection is performed via twist pair cable shield with $90\Omega \pm 15\%$ characteristic impedance(Differential Mode). USB standard defines that output impedance of USB driver must be in range from 28Ω to 44Ω . So, discrete series resistor (R_s) addition is defined in order to satisfy the above definition and keep balance. When using this USB I/O, use it with 25Ω to 30Ω (recommendation value 27Ω) series resistor R_s .

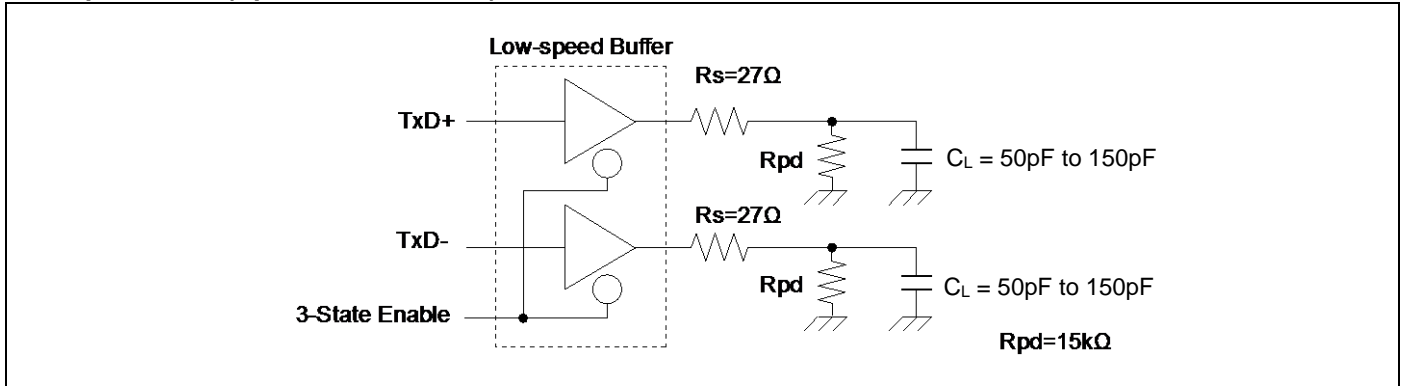

*7: They indicate rising time (T_{rise}) and falling time (T_{fall}) of the low-speed differential data signal. They are defined by the time between 10% and 90% of the output signal voltage.

12.8 Flash Memory Write/Erase Characteristics
12.8.1 Write / Erase time

(Vcc = 2.7V to 5.5V, Ta = - 40°C to + 105°C)

Parameter		Value		Unit	Remarks
		Typ*	Max*		
Sector erase time	Large Sector	0.7	3.7	s	Includes write time prior to internal erase
	Small Sector	0.3	1.1		
Half word (16-bit) write time		12	384	μs	Not including system-level overhead time
Chip erase time	64K/128K/256KByte	5.2	23.6	s	Includes write time prior to internal erase
	384K/512KByte	8	38.4	s	

*: The typical value is immediately after shipment, the maximum value is guarantee value under 100,000 cycle of erase/write.

12.8.2 Erase/Write cycles and data hold time

Erase/write cycles (cycle)	Data hold time (year)	Remarks
1,000	20*	
10,000	10*	
100,000	5*	

*: At average + 85°C

12.9 Return Time from Low-Power Consumption Mode

12.9.1 Return Factor: Interrupt

The return time from Low-Power consumption mode is indicated as follows. It is from receiving the return factor to starting the program operation.

Return Count Time

(V_{CC} = 2.7V to 5.5V, T_a = - 40°C to + 105°C)

Parameter	Symbol	Value		Unit	Remarks
		Typ	Max*		
SLEEP mode	Ticnt	t _{CYCC}		ns	
High-speed CR TIMER mode, Main TIMER mode, PLL TIMER mode		40	80	μs	
Low-speed CR TIMER mode		453	737	μs	
Sub TIMER mode		453	737	μs	
STOP mode		453	737	μs	

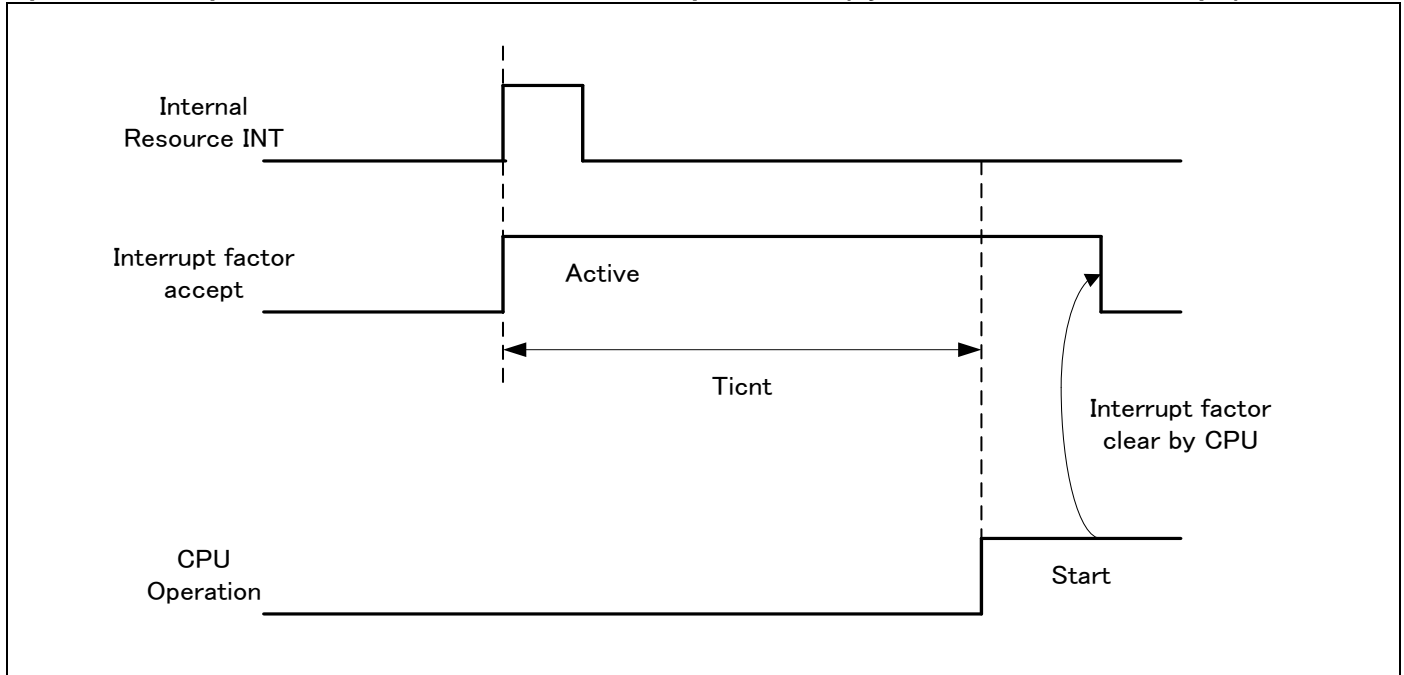

*: The maximum value depends on the accuracy of built-in CR.

Operation example of return from Low-Power consumption mode (by external interrupt*)

*: External interrupt is set to detecting fall edge.

Operation example of return from Low-Power consumption mode (by internal resource interrupt*)

*: Internal resource interrupt is not included in return factor by the kind of Low-Power consumption mode.

Notes:

- The return factor is different in each Low-Power consumption modes.
See "Chapter 6: Low Power Consumption Mode" and "Operations of Standby Modes" in FM3 Family Peripheral Manual about the return factor from Low-Power consumption mode.
- When interrupt recovers, the operation mode that CPU recovers depends on the state before the Low-Power consumption mode transition. See "Chapter 6: Low Power Consumption Mode" in "FM3 Family Peripheral Manual".

12.9.2 Return Factor: Reset

The return time from Low-Power consumption mode is indicated as follows. It is from releasing reset to starting the program operation.

Return Count Time

($V_{CC} = 2.7V$ to $5.5V$, $T_a = -40^{\circ}C$ to $+105^{\circ}C$)

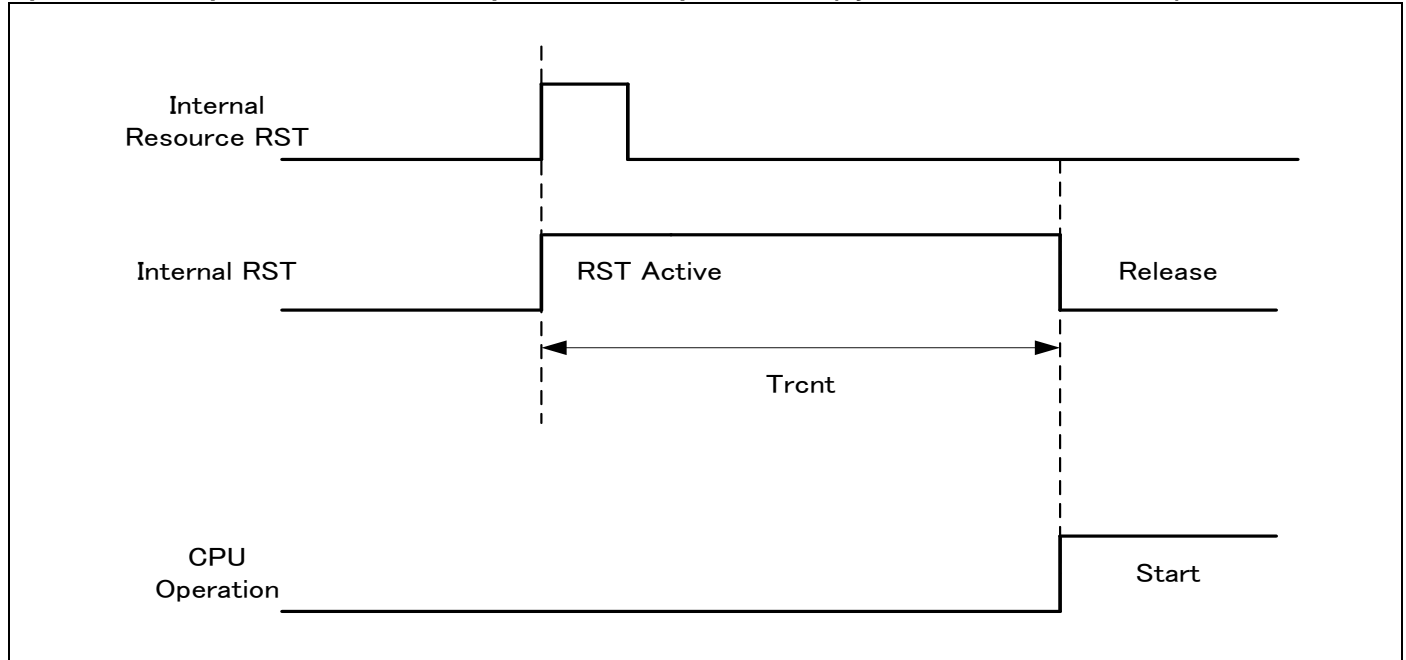

Parameter	Symbol	Value		Unit	Remarks
		Typ	Max*		
SLEEP mode	Trcnt	308	444	μs	
High-speed CR TIMER mode, Main TIMER mode, PLL TIMER mode		308	444	μs	
Low-speed CR TIMER mode		428	684	μs	
Sub TIMER mode		428	684	μs	
STOP mode		428	684	μs	

*: The maximum value depends on the accuracy of built-in CR.

Operation example of return from Low-Power consumption mode (by INITX)

Operation example of return from low power consumption mode (by internal resource reset*)

*: Internal resource reset is not included in return factor by the kind of Low-Power consumption mode.

Notes:

- The return factor is different in each Low-Power consumption modes.
See "Chapter 6: Low Power Consumption Mode" and "Operations of Standby Modes" in FM3 Family Peripheral Manual.
- When interrupt recovers, the operation mode that CPU recovers depends on the state before the Low-Power consumption mode transition. See "Chapter 6: Low Power Consumption Mode" in "FM3 Family Peripheral Manual".
- The time during the power-on reset/low-voltage detection reset is excluded. See "12.4.7. Power-on Reset Timing in 12.4. AC Characteristics in 12Electrical Characteristics.Electrical Characteristics" for the detail on the time during the power-on reset/low -voltage detection reset.
- When in recovery from reset, CPU changes to the high-speed CR run mode. When using the main clock or the PLL clock, it is necessary to add the main clock oscillation stabilization wait time or the Main PLL clock stabilization wait time.
- The internal resource reset means the watchdog reset and the CSV reset.

LCC-64P-M24
7	PRODUCT LINEUP Function Multi-function Serial	Added the following description. ch.4 to ch.7: FIFO (16steps × 9-bit) ch.0 to ch.3: No FIFO
	External Interrupts	Corrected the following description. 7pins (Max) → 8pins (Max)
34 to 37	SIGNAL DESCRIPTION Multi-function Serial (ch.0 to ch.7)	Corrected the description for function. Added "LIN pin" Deleted "UART pin"
42, 43	I/O CIRCUIT TYPE	Corrected the following schematic for "TypeB". CMOS level hysteresis input → Digital input Corrected the following schematic for "TypeC". Control Pin → Digital output
51	HANDLING DEVICE Power supply pins	Corrected the description.
54	MEMORY SIZE	Added "MEMORY SIZE".
69	ELECTRICAL CHARACTERISTICS 4. AC Characteristics (1)Main Clock input Characteristics	Added the items F_{CM} to the Internal operating clock frequency.
71	(4-2) Operating Conditions of Main PLL	Added the description.
72	(7) External Bus Timing External bus clock output Characteristics	
79	(8) Base Timer Input Timing Trigger input timing	
88	(10) External input timing	Added the Note.
88	(10) External input timing	Corrected the footnote.
94	5. 12-bit A/D Converter (1) Electrical characteristics for the A/D converter	Corrected the value of "Full-scale transition voltage". Min: -20 → AVRH-20 Max: +20 → AVRH+20 Corrected the value of "Compare clock cycle". Max: 10000 → 2000 Corrected the value of "Reference voltage". Min: AVSS → 2.7
Revision 2.1		
-	-	Company name and layout design change
Revision 3.0		
2	FEATURES USB Interface	Added the description of PLL for USB

Page	Section	Change Results
3	FEATURES External Bus Interface	Added the description of Maximum area size
9	PACKAGES	Deleted FPT-64P-M24, FPT-64P-M23, FPT-80P-M21, FPT-100P-M20
44, 46	I/O CIRCUIT TYPE	Added the description of I ² C to the type of E, F and I
44, 45	I/O CIRCUIT TYPE	Added about +B input
51	HANDLING DEVICES	Added "Stabilizing power supply voltage"
51	HANDLING DEVICES Crystal oscillator circuit	Added the following description "Evaluate oscillation of your using crystal oscillator by your mount board."
52	HANDLING DEVICES C Pin	Changed the description
53	BLOCK DIAGRAM	Modified the block diagram
54	MEMORY SIZE	Changed to the following description See "Memory size" in "PRODUCT LINEUP" to confirm the memory size.
55	MEMORY MAP Memory map(1)	Modified the area of "External Device Area"
56, 57	MEMORY MAP Memory map(2)(3)	Added the summary of Flash memory sector and the note
64, 65	ELECTRICAL CHARACTERISTICS 1. Absolute Maximum Ratings	Added the Clamp maximum current Added the output current of P80 and P81 Added about +B input
66	ELECTRICAL CHARACTERISTICS 2. Recommended Operation Conditions	Modified the minimum value of Analog reference voltage Added Smoothing capacitor Added the note about less than the minimum power supply voltage
67, 68	ELECTRICAL CHARACTERISTICS 3. DC Characteristics (1) Current rating	Changed the table format Added Main TIMER mode current Added Flash Memory Current Moved A/D Converter Current
71	ELECTRICAL CHARACTERISTICS 4. AC Characteristics (3) Built-in CR Oscillation Characteristics	Added Frequency stability time at Built-in high-speed CR
72	ELECTRICAL CHARACTERISTICS 4. AC Characteristics (4-1) Operating Conditions of Main and USB PLL (4-2) Operating Conditions of Main PLL	Added Main PLL clock frequency Added USB clock frequency Added the figure of Main PLL connection and USB PLL connection
73	ELECTRICAL CHARACTERISTICS 4. AC Characteristics (6) Power-on Reset Timing	Added Time until releasing Power-on reset Changed the figure of timing
75-77	ELECTRICAL CHARACTERISTICS 4. AC Characteristics (7) External Bus Timing	Modified Data output time
82-89	ELECTRICAL CHARACTERISTICS 4. AC Characteristics (8) CSIO/UART Timing	Modified from UART Timing to CSIO/UART Timing Changed from Internal shift clock operation to Master mode Changed from External shift clock operation to Slave mode
96	ELECTRICAL CHARACTERISTICS 5. 12bit A/D Converter	Added the typical value of Integral Nonlinearity, Differential Nonlinearity, Zero transition voltage and Full-scale transition voltage Modified Stage transition time to operation permission Modified the minimum value of Reference voltage
105-108	ELECTRICAL CHARACTERISTICS 9. Return Time from Low-Power Consumption Mode	Added Return Time from Low-Power Consumption Mode
109	ORDERING INFORMATION	Change to full part number
110	PACKAGE DIMENSIONS	Deleted FPT-64P-M24, FPT-64P-M23, FPT-80P-M21, FPT-100P-M20
