8) Integrated protection functions are designed to prevent IC destruction under fault conditions described in the data sheet. Fault conditions are considered as "outside" normal operating range. Protection functions are not designed for continuous repetitive operation.

9) Short circuit current limit for max. duration of 400  $\mu\text{s}$ , prior to shutdown (see  $t_{d(SC)}$  page 4)

10) While demagnetizing load inductance, dissipated energy in PROFET is  $E_{AS} = \int V_{ON(CL)} * i_L(t) dt$ , approx.  
 $E_{AS} = 1/2 * L * I_L^2 * (\frac{V_{ON(CL)}}{V_{ON(CL)} - V_{bb}})$ , see diagram page 8.

11) Reverse load current (through intrinsic drain-source diode) is normally limited by the connected load. Reverse current  $I_{GND}$  of  $\approx 0.3\text{ A}$  at  $V_{bb} = -32\text{ V}$  through the logic heats up the device. Time allowed under these condition is dependent on the size of the heatsink. Reverse  $I_{GND}$  can be reduced by an additional external GND-resistor (150  $\Omega$ ). Input and Status currents have to be limited (see max. ratings page 2 and circuit page 7).
